Array:
Define Array:
array_name data_type values
a DB 10, 20, 30, 40, 50

Array Indexing:
MOV BL, a[0]

With Index Register: SI
MOV BL, a[SI]

For looping:
i. MOV the value to CX for the number of iterations
ii. INC SI

To define an empty array:
c DB 5 dup(?)

For Word Data which takes 2 bytes we have to increment by 2 where
Higher byte stays at higher address
Lower byte stays at lower address

a DW 10, 20, 30, 40, 50

N.B: a DB 5 dup(1,2) -> 1, 2 , 1, 2, 1, 2, 1, 2, 1, 2

Stack:
.STACK 100h -> Reserves 0h to 100h for Stack
* 100h is the top address of the stack.
* SP is used for accessing stack. Since it is a 16 bit register, everything is word size.
* SP always points to the top of the stack which is 100h initially.
